

How To Correct Audio Sync Issues In iMovie

1. The easiest way to correct out-of-sync audio in iMovie is to select the clip, go to the **Advanced menu**, and choose **Extract Audio**.

2. Alternative methods are to select the clip and “**Share**” to QuickTime, or export the movie to a **video camera** (MiniDV), and **re-import** it into iMovie.

Tip: When digitizing VHS to a digital format, make sure that the converter is set to **16 bit audio**. This produces better sound quality than a CD; 12 bit audio is the same quality as a CD.

The encoder settings for best performance of a DVD are set to a maximum duration of **60 minutes**. Make sure your project is no longer than 60 minutes because otherwise the compressor can make your audio go out of sync.
